Today, we are initially targeting the ER-2 on precipitation in Colorado's Front Range, with a take off time at 18 UTC/13 CDT, full duration mission.

We will coordinate legs with ops at the CF and CSU-CHILL radar staff.

We will possibly vector the ER-2 to Oklahoma should intense convection develop west of the CF, nominally around 20-21 UTC.

Should the Citation be able, we would ask for a 20-21 UTC takeoff to sample stratiform/anvils near the CF.
